

# An introduction to the iViis mobile app:

The iViis Mobile app allows you to deploy key business functions of your iViis cloud application on your users' phones and tablets. This can result in significant improvements in user connectedness and the timeliness and quality of interactions with your iViis cloud application.

Deploying the app is incredibly quick and simple; simply create one or more forms in your iViis cloud application in the same way you would any other form, target the form to the mobile platform, and your mobile app is ready to use.

All the core features of your iViis application (e.g. login details, form and data access rules, data validation, and many others) are inherited automatically from your iViis application; nothing further is required.

## Getting started

Download and install the iViis Mobile app from the Apple or Google app stores. Using your desktop browser create a mobile-targeted form (using the mobile form templates provided), and grant access to it to your users. Log into the mobile app using your regular username and password. You're done!

## Fully connected, instantly updated

Your mobile app is fully connected to your iViis cloud application meaning forms and data are continually synchronised and immediately up to date on all devices, with no requirement for users to update the app via the app stores.

## Security

All the security settings configured in your iViis cloud application are adhered to by the mobile app. For additional security, you can require your users to get an authorisation code from your iViis cloud application. You can set the number of mobile devices per user to be limited to (say) 2 devices. You can allow your users to set up a device pin which can be used as a quick means of logging in.

## Push notifications

Your iViis application can generate the native push notifications that your phone uses (the ones that appear on your lock screen).

## Off-line capability

Forms can be configured to be used off-line, with data

stored on your local device and then synchronised with the iViis cloud application the next time you are on-line.

## Branding

Your mobile app appears in the app stores and on your phone app icons as the 'iViis Mobile' app. However, once you log in the first time all in-app look and feel can be configured to match your corporate styling. To brand the app store version and phone app icons with your corporate identity requires some additional steps wherein you submit the app under your corporate identity.

## Mobile form templates

To make things even easier, when you create a new mobile-targeted form you can make use of a range of pre-configured form templates, which when used provide a complete working mobile form in seconds.

## Access to hardware features

Your mobile form can make use of all phone hardware features including GPS, camera, accelerometer, fingerprint reader etc. For example, the GPS might be used to automatically select the branch or site the user is approaching.

## More information

For more information on how you can make use of the iViis Mobile app please contact your local iViis representative.

## Examples of use

- Apply for leave
- Approve leave
- Check leave balances
- Take site or branch photos
- Site or branch safety audits
- Update project status
- Show emergency contacts (off-line)
- Show emergency procedures (off-line)
- Update my location
- Bar/QR code scanning
- OCR scanning
